See More. Do More. Save Time.

You want your design to shine, and that means seeing more signals in new ways. Be ready with a Keysight Infiniium MXR-Series oscilloscope: it's your window into the intricate interactions of complex designs. Get from symptom to resolution fast by coupling the efficiency of an 8-in-1 bench solution with unprecedented simultaneous 8 channel performance.

Meet the Infiniium MXR-Series

Welcome to the all-new Infiniium MXR-Series. With twelve models ranging in performance from 500 MHz to 6 GHz, 4 or 8 analog channels, and dozens of hardware and software options, the Infiniium MXR-Series is designed to meet your needs today. And with a platform that is fully upgradeable – with no exceptions - it will be ready for your measurement needs tomorrow.

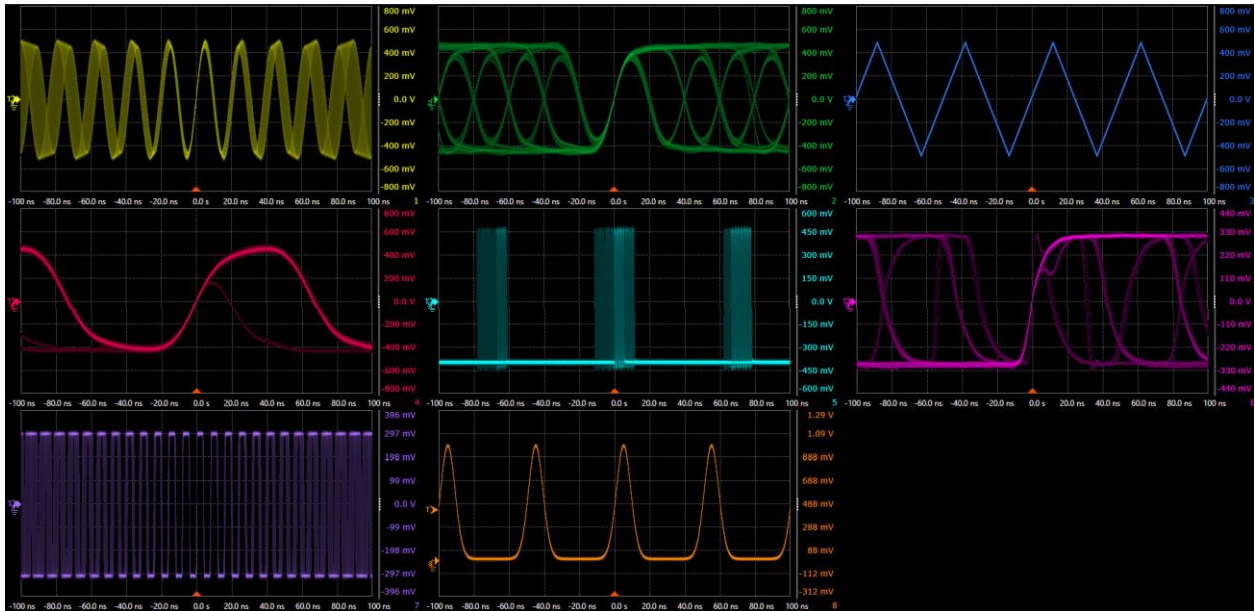

Infiniium MXR-Series Specifications	
Analog channels	4 or 8, <i>upgradeable</i>
Bandwidth	500 MHz to 6 GHz, <i>upgradeable</i>
Sample rate	16 GSa/s
Memory	200 Mpts, <i>upgradeable</i> to 400 Mpts or new 1.6 Gpts flexible memory ¹
Resolution	10 bits, up to 16 with high resolution
ENOB	As high as 9.0
Timebase accuracy	8 parts per billion
Intrinsic Jitter	As low as 118 fs
Noise (1 mV/div)	As low as 43 μ V
Digital logic channels	16, dedicated input, <i>upgradeable</i>
Integrated tools	8-in-1
Eye diagram speed	> 750,000 UI/s
Screen display	15.6\" touch, full HD, dual screen support

1. See data sheet spec tables to learn more about the all-new 1.6 Gpts combined flexible memory option.

See More in the Time Domain with Eight Analog Channels

The Infiniium MXR-Series is the first oscilloscope to offer 6 GHz bandwidth and 16 GSa/s sample rate on every single one of its four or eight channels. Combined with being the first oscilloscope with 200 Mpts of standard memory per channel, flexible three-stage triggering, over 50 standard measurements, a massive library of application specific packages, and ASIC-accelerated testing, the Infiniium MXR-Series lets you see more of your signal than ever before.

See More with World-Class Signal Integrity

Each model incorporates a 10-bit ADC with a sample rate of 16 GSa/s available on all channels simultaneously. A high-resolution ADC's usefulness is dependent on the low-noise front end that supports the additional quantization levels. Our low noise front end includes custom ICs, like the 130 nm BiCMOS IC that incorporates user-selectable analog filters and bandwidth upgrades via a software license. This gives you:

- 4 times more vertical resolution than 8-bit oscilloscopes
- Up to 16 bits with high-res mode
- As low as 43 μ V of noise, 9.0 bits system ENOB with hardware filtering

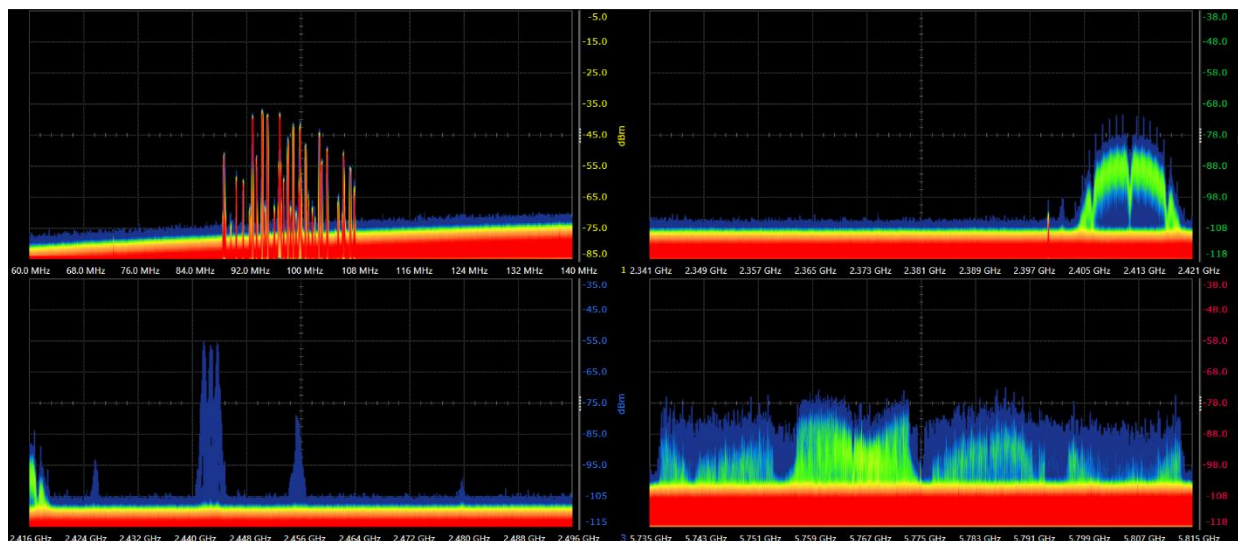

See More Information with History Mode and Segmented Memory

The Infiniium MXR-Series comes standard with two useful tools that allow you to look forward and backward in time. With history mode, simply stop the oscilloscope at any time to review up to 1,024 previous trigger events. With segmented memory, you can capture > 100,000 events post-trigger for analysis, with no limit between events. If your design has an elusive event that only seems to happen when you're not around, these tools can help you arm the oscilloscope to look for it, then let you review what gets captured at your leisure. And with a full HD screen of 1920x1080 pixels, and support for a second, independent external monitor, that data can be organized and displayed however is best for you.

See More in the Frequency Domain with Real-Time Spectrum Analysis

Perform powerful RF analysis with up to 8 phase-coherent channels, all at once. Digitally down-convert data on all 8 channels simultaneously with an analysis bandwidth up to 2 GHz. The RTSA view in the Infiniium MXR-Series provides spans from 40 MHz to 320 MHz. In this image, we're viewing (clockwise) local US radio stations (~100 MHz), 2.4 GHz WLAN channel 1, 5 GHz WLAN channel 157, and Bluetooth all at once. And since the data is from the analog channel inputs, they are phase coherent by definition, with only a standard calibration required to ensure accuracy. And with a maximum frequency range of 6 GHz, the Infiniium MXR-Series easily supports applications from ZigBee to 5G FR1.

Do More with 8-in-1 Instrument Integration

The Infiniium MXR-Series is more than just an oscilloscope - it's 8 instruments in 1. Keysight Technologies, Inc. pioneered multiple-instrument integration with the release of the mixed signal oscilloscope (MSO) in 1996. The InfiniVision 2000/3000/4000X-Series took the concept to the next level by integrating five instruments in one in 2011. The Infiniium MXR-Series now integrates eight instruments in one to establish a new integration standard, with the first ever real-time spectrum analyzer on an oscilloscope.

- Oscilloscope
- Logic analysis
- Real-Time Spectral Analysis
- Serial protocol analysis
- Waveform generator
- Frequency response
- Digital voltmeter
- Triple counters with totalizer
- Phase noise testing

Product sizes to scale!

Generating a 10 MHz sine wave with frequency modulation, while measuring two signal frequencies with counters and a third signal's DC voltage with the DVM. Note that channels need not be enabled for the counter and DVM to operate

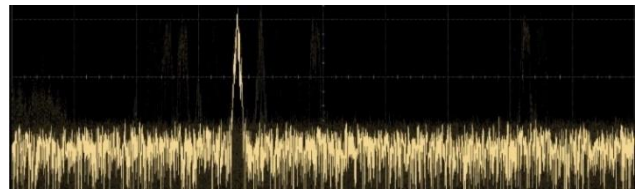

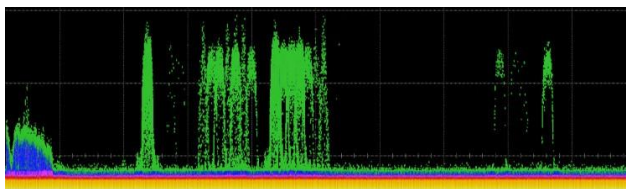

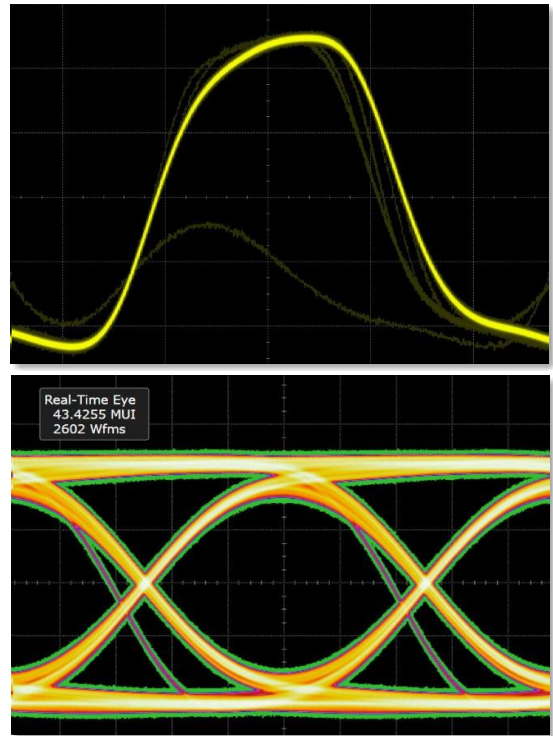

Save Time with Groundbreaking ASIC Technology

The Infiniium MXR-Series leverages a 100M+ gate CMOS ASIC from our UXR-Series oscilloscope, and acts as an “oscilloscope on a chip”. With many core oscilloscope features done in hardware, performance of some features improved by 100x or more over previous generations, including:

- Triggering and plotting: **200x faster**
- Eye diagrams: **50x faster**
- FFT plotting: **400x faster**
- Waveform averaging: **120x faster**
- And more!

In these images to the right, the fast trigger rate of > 200,000 waveforms per second means seeing the runt on screen is instantaneous, even though it occurs only on 0.02% of pulses. Fast triggering lets you see rare events more readily, reducing test time by avoiding the usual tricks like infinite persistence to capture rare events. Eye diagrams are plotted at speeds over 750,000 UI per second, meaning six-sigma can be achieved in mere seconds. And below, RTSA’s speed of 200,000 FFT plots per second mean that even this bursty Bluetooth data is captured easily, while nearly invisible with usual FFT (~1,000 plots per second).

Highly dynamic Bluetooth data is difficult to capture consistently with standard FFT (right), but easy with RTSA (left).

Save Time with the All New Fault Hunter Application

Fault Hunter is a new and innovative expert system for inspecting digital systems. It automatically evaluates your signal’s characteristics against user definable criteria, quickly finding and saving errors for your review. It’s flexible, and you can define the test duration from 60 seconds up to 48 hours. Set up your device under test on a Friday afternoon, and return Monday morning with a full test report to review, with billions of tests complete.

Completely Upgradeable

Today’s project requires 4 channels of 1 GHz analysis bandwidth. What if your next project needs 8 channels, and 6 GHz of analysis bandwidth? And a waveform generator? And compliance testing? No problem with the Infiniium MXR-Series, which is fully upgradeable – no exceptions.

The Infiniium MXR-Series is the world’s first benchtop oscilloscope to offer an upgrade from 4 to 8 analog channels. Along with this, you can upgrade bandwidth, memory, integrated equipment, applications and more after purchase, with just a license key. No matter how your needs change, the Infiniium MXR-Series protects your investment by growing with your lab’s needs of tomorrow.

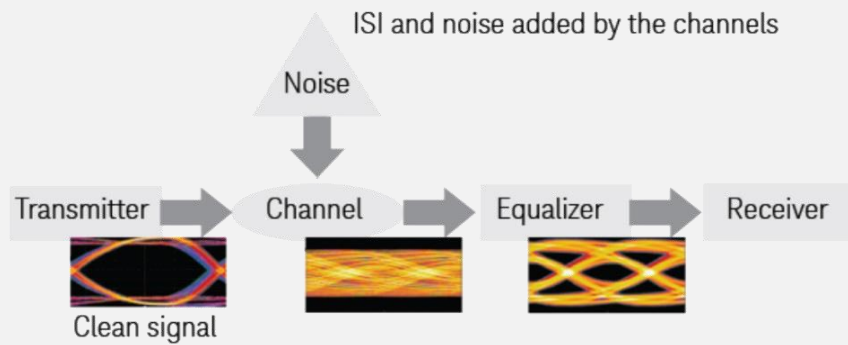

Post-Purchase Upgrades	Model
Add analog bandwidth, up to 6 GHz	MXR2BW
Add analog channels, 4 to 8	MXR28CH
Add memory, 400 Mpts/ch or 1.6 Gpts/ch flexible memory	MXR2MEM
Add RTSA and DDC	MXR2RTSA
Add RF Frequency Extension, 6 GHz	MXR2FRE
Add waveform generator, 50 MHz	MXR2WAV
Add MSO, 16 channels	MXR2MSO

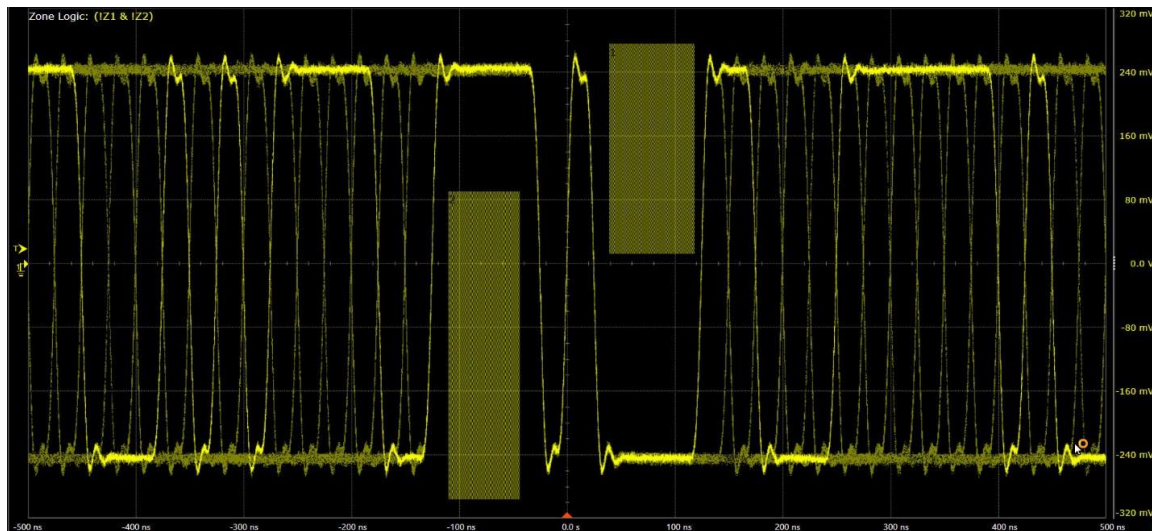

Comprehensive Testing Applications

Signal Integrity Testing

As data rates go up, the signal deteriorates from the transmitter to the receiver due to ISI, noise, and other factors. A high data rate coupled with a lossy channel will cause an open eye at a transmitter to be closed at the receiver. As eyes get more and more closed, it ultimately leads to significant data corruption and errors. Being able to analyze and find the root cause of these problems can help you develop a more robust design, leading to shorter time to market and lower failure rates in the field. The Infiniium MXR-Series offers applications of various levels of depth to help you get the answers you need to improve your design.

InfiniiScan Advanced and Zone Triggering – D9010SCNA

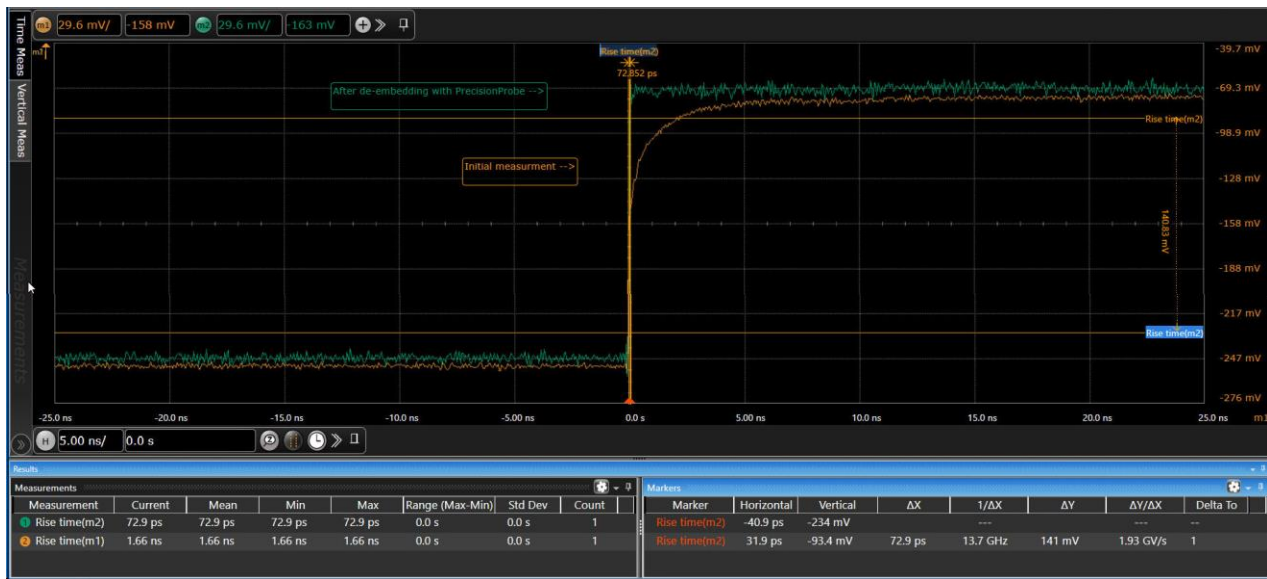

This package allows you to create a three-stage trigger to identify signal integrity issues that hardware triggering is unable to find in your electronic designs. This innovative software scans through thousands of acquired waveforms per second to help you isolate signal anomalies, saving you precious troubleshooting time. Trigger by drawing on-screen regions for a signal to hit or miss, or based on measured parameters.

Vertical, Timing, and Phase Noise Analysis – D9010JITA

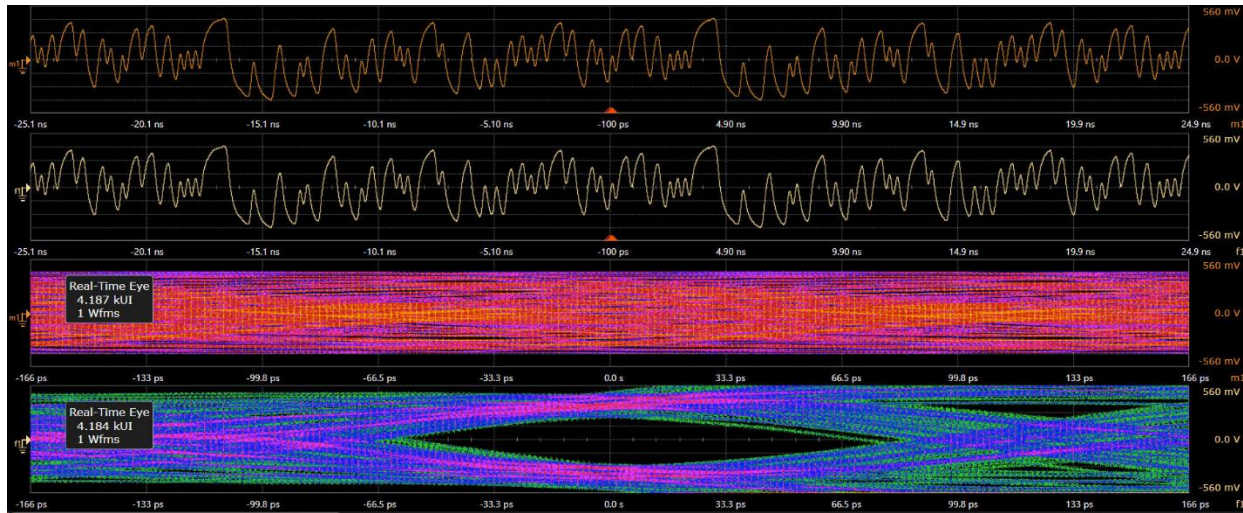

This package offers advanced statistical analysis of high-speed digital interfaces in the vertical (voltage) and horizontal (time) domains, as well as phase noise analysis. The result: the industry’s most complete jitter and noise analysis software for real-time oscilloscopes.

De-embedding – D9010DMBA

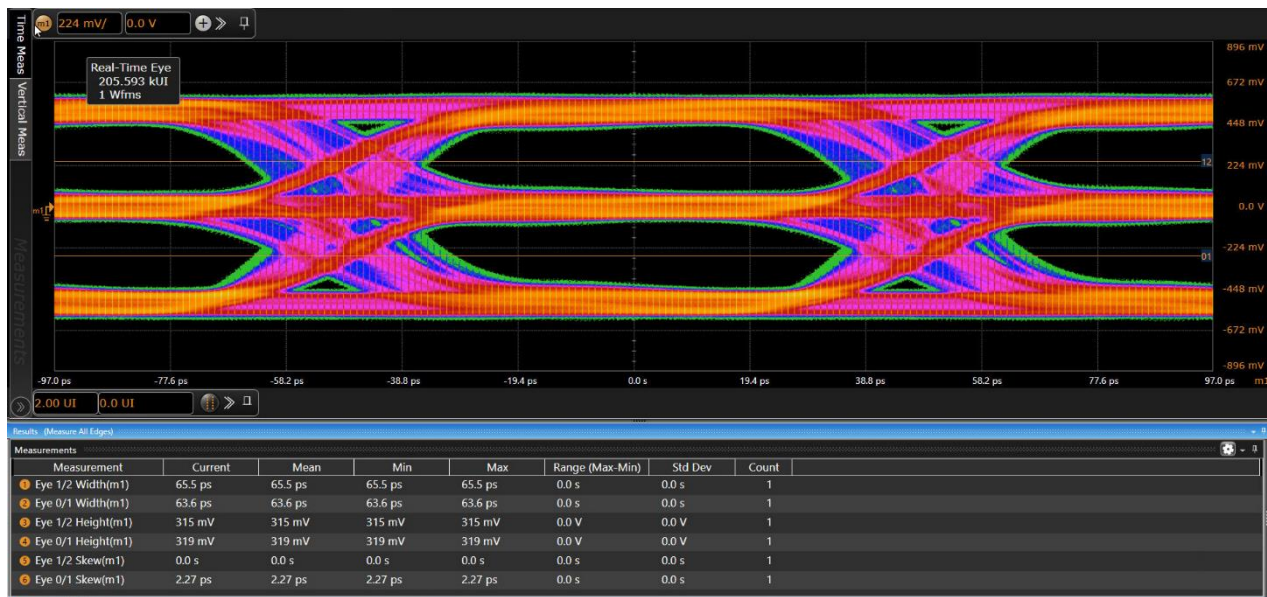

This package includes PrecisionProbe and InfiniiSim Basic, two tools designed to de-embed the effect of cables and fixtures from measurements. PrecisionProbe allows you to characterize the response of a probe, cable or fixture; InfiniiSim lets you model them out of a measurement.

Equalization and Crosstalk – D9020ASIA

This package is intended for anyone working in high speed digital applications where eyes are closed. Equalization, InfiniiSim, and Crosstalk/Power Integrity packages enable deep analysis as to why an eye is closed, what it will take to open it, and simulating the results.

PAM-3 and PAM-4 Analysis – D9010PAMA

This package quickly sets up clock recovery and measurements for a PAM encoded signal. The software is also able to accurately set the individual threshold levels of your PAM signal and render each individual eye. It also includes BER/SER measurements and statistics.

Power Supply, Rail, and PMIC Testing

The increased functionality, higher density, and higher frequency operation of many modern electronic products has driven the need for lower supply voltages. It is common in many designs today to have 3.3, 1.8, 1.5, and even 1.1 V DC supplies—each of them having tighter tolerances than in previous product generations.

Power supply induced jitter (PSIJ) can be one of the largest sources of clock and data jitter in digital systems. Similarly, noise on DC supplies is often caused by switching currents from the transitions of clock and data in these systems. Wouldn't you like a relatively easy method of determining how much of your systems' data jitter is PSIJ and/or how much of the noise on the DC supplies is coming from specific clocks, data lines or other toggling sources? We've got the tools for that in the Infiniium MXR-Series.

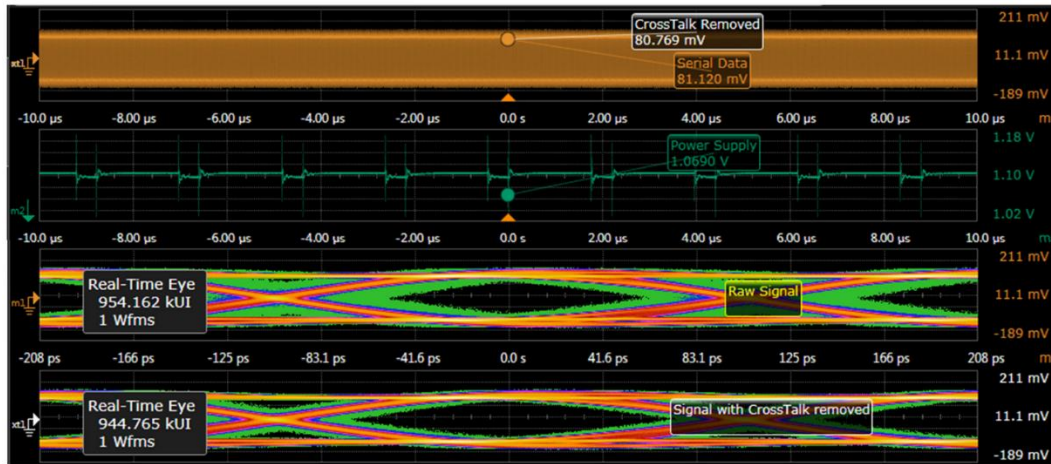

Switch Mode Supplies – D9010PWRA

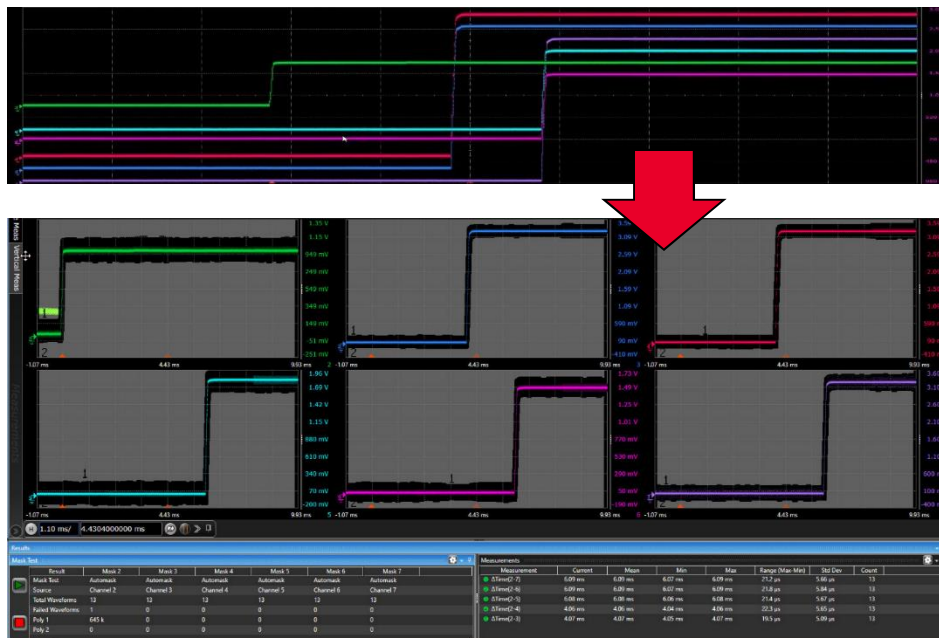

This application enables a broad range of automated power supply characterization measurements from input analysis, switching device characterization, and output analysis. It also includes critical frequency response measurements such as power supply rejection ratio (PSRR) and control loop response. Additionally, users can create Bode plots from DC to 50 MHz, both magnitude and phase, with D9010PWRA. See the data sheet for more.

Power Rail and PMIC Integrity – D9010POWA

This application is a tool for analyzing power supply induced jitter or switching current loads on a DC supply, and can analyze adverse interactions and their effects without the need for simulation or complex modeling. Together with the N7020A or N7024A Power Rail Probe, you have an even more powerful means of measuring and analyzing power integrity. And with standard mask testing on every channel, automatic delta time measurements, and a flexible user interface, PMIC analysis is simpler than ever.

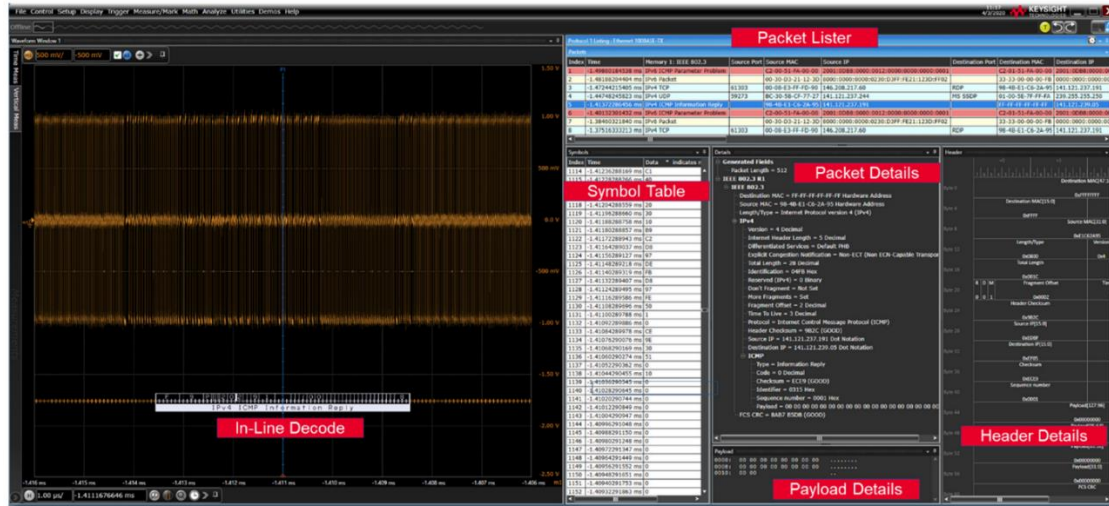

By simulating a power supply with less noise, we can realize much wider eye diagrams, leading to more robust transfer of data.

With waveforms separated into grids and independent mask tests possible on every channel, you can continuously test these six power rails over thousands of startup cycles.

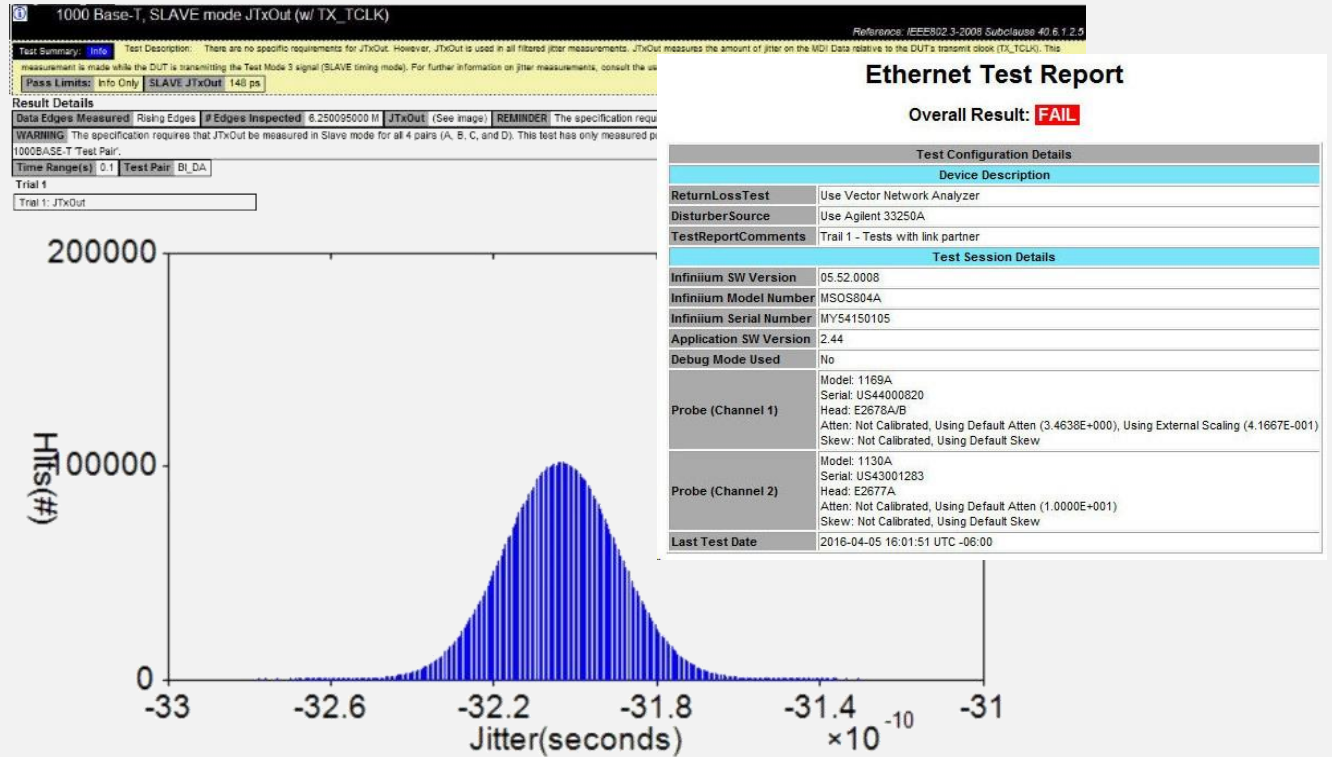

Industry Specific Protocol Testing

Our protocol trigger and decode packages make easy to debug and test digital designs. Get access to a rich set of integrated protocol level triggers specific to each serial bus. When serial triggering is selected, the application enables special real-time triggering hardware inside the scope. Hardware-based triggering ensures that the scope never misses a trigger event when armed. This hardware takes signals acquired using either scope or digital channels and reconstructs protocol frames. It then inspects these protocol frames against specified protocol-level trigger conditions and triggers when the condition is met.

Compliance Testing

Compliance test applications on the Infiniium MXR-Series provide a fast and effortless way to validate that your designs meet industry standards. They save you time and money by automating the task of performing compliance measurements based on the latest requirements. These test application offers a user-friendly setup wizard and a comprehensive report that includes margin analysis. Contact Keysight if you are looking for a compliance test solution, so we can help you pick the right tools for the job.

RF Testing

With digital down-conversion (DDC) on every channel, the Infiniium MXR-Series provides you much more flexibility and affordability for RF testing, as well as never before seen test performance. Digitally down-converted data can be displayed and measured on screen, visualized in a Real-Time Spectrum Analyzer (RTSA) mode, or exported to PathWave Vector Signal Analysis (89600 VSA) for further measurements. All models come standard with 40 MHz of analysis bandwidth for DDC and RTSA on one center frequency, with options for 160 or 320 MHz of analysis on 4 or 8 different center frequencies.

And with our all new Frequency Extension option, the frequency range for DDC and RTSA is not limited to the bandwidth of your oscilloscope. For example, if your measurement needs in the time domain only call for 2 GHz of analog bandwidth, but you wish to analyze wireless data up to 6 GHz, you can purchase a 2 GHz Infiniium MXR-Series and still get 6 GHz analysis with DDC and RTSA. See specifications for details.

+ RTSA/DDC Option + Frequency Extension Option	0 Hz to 6 GHz	RTSA: 160/320 MHz DDC: 2 GHz	Independent per channel

Combine Two Oscilloscopes For 16 Channel Test with MultiScope

With software 11.10 or greater, you can combine two MXR-Series oscilloscopes together using a cabling system to perform 16 channel tests. This gives you the ability to have individual 4 or 8 channel oscilloscopes when needed and combine oscilloscopes on the fly when higher channel density measurements are required. All channels from each oscilloscope can be viewed and analyzed on a “leader” oscilloscope or managed from your PC using Infiniium Offline.

MultiScope is a standard feature of the MXR-Series oscilloscope and of Infiniium Offline – the only requirement to combine two oscilloscopes is the cabling kit. Specifications for frame-to-frame jitter, setup instructions, and ordering information can be found in the MultiScope Brochure and User’s Guide. Simply search for “MultiScope” on our website or look in the technical documentation on your oscilloscope model’s product page.

Maximize Test Flexibility with Infiniium Offline

You depend on your oscilloscope to capture an accurate picture of what’s happening in your design. But in today’s environment, you may find yourself in a variety of situations where access to an oscilloscope is limited. you may be sharing the instrument with others in the lab, have limited site access, or are trying to collaborate with a colleague remotely. Infiniium Offline can solve all of these problems, and more.

Infiniium Offline (D9010BSEO) is a copy of the same powerful software provided on your Infiniium MXR-Series oscilloscope, just without the oscilloscope hardware. If you wish to control an oscilloscope remotely from the comfort of your desk or home office, the hosted mode can connect and control a single MXR-Series, or many MXR-Series with the MultiScope application outlined above. When access to the oscilloscope is limited, you can capture waveforms on your scope, save to a file, and recall the waveforms into Infiniium Offline from any PC. In addition, the application supports a variety of popular waveform formats from multiple oscilloscope vendors. Now you can view, analyze, share, and document scope measurements anywhere your PC goes. Find model numbers in the configuration guide at the end of this document.

Explore the Keysight Real-Time Oscilloscope Portfolio

Keysight engineers have been creating reliable, insightful products for more than 80 years. We are continually looking for new ways to help you shape the future with innovative products and test solutions. From high performance to extreme value, and bandwidths ranging from 50 MHz to more than 110 GHz, we have the oscilloscope solutions to meet your evolving needs. 1. Denotes warranted specifications, all others are typical. Specifications are valid after a 30-minute warm-up period and ± 5 °C from firmware calibration temperature. Input impedance is valid when V/div scaling is adjusted to show all waveform vertical values within the oscilloscope display.
2. Full scale is defined as 8 vertical divisions. Magnification is used below 2 mV/div, full-scale is defined as 16 mV. Testing is at maximum sample rate.
3. 50 Ω input: The major scale settings are 5 mV, 10 mV, 20 mV, 50 mV, 100 mV, 200 mV, 500 mV, and 1 V per division. 1 M Ω input: The major scale settings are 5 mV, 10 mV, 20 mV, 50 mV, 100 mV, 200 mV, 500 mV, 1 V, 2 V, and 5 V per division. For a 10:1 probe, vertical scaling is multiplied by 10.
4. 10/90 calculation based on $T_r = 0.43/BW$. 20/80 calculation based on $T_r = 0.31/BW$.
5. You may adjust bandwidth limits up to the bandwidth of the scope when using Brick Wall filter. When using 4th Order Bessel, maximum bandwidth limit is roughly 2/3 the bandwidth of oscilloscope. Bandpass is designed for use in our Phase Noise Analysis application and not designed for general purpose use. Contact Keysight if more information is needed.
6. Combined flexible memory shares 1.6 Gpts of memory between channels 1 through 4. This means you can have 1 channel with 1.6 Gpts, two channels with 800 Mpts, or three channels with 533 Mpts memory (on top of 400 Mpts on all channels). Double those channel counts for 8 channel models, as the same logic applies to channels 5-8.

1 V/div	2.95 mV	4.10 mV	5.07 mV	6.33 mV	8.4 mV	9.31 mV	11.91 mV	16.26 mV

1. High-resolution is used for bandwidths 2 GHz and below. Keysight recommends this to maximize signal to noise ratio and still meet the system bandwidth requirements you need for your measurement.

ENOB on 50 Ω inputs, 50 mV/div											
20 MHz	200 MHz	250 MHz	350 MHz	500 MHz	1 GHz	2 GHz	2.5 GHz	3 GHz	4 GHz	5 GHz	6 GHz
9.0	8.5	8.4	8.3	8.2	8.0	7.6	7.5	7.4	7.2	7.1	6.8

High resolution on the Infiniium MXR-Series works like no other oscilloscope before it. Instead of setting high-resolution bits automatically with no user control, you select ADC bits or a system bandwidth, and let the scope optimize around that. This means the resolution of your data isn't changing without your explicit request. ADC resolution and bandwidth limit filters work in tandem to produce the best measurement results possible.

All Infiniium MXR-Series scopes come from the factory calibrated to 6 GHz, and leverage brickwall filters to achieve each model bandwidth. Thus, the noise and ENOB data above is applicable from 20 MHz up to the bandwidth of your oscilloscope model when using the built-in global bandwidth limit feature.

Analog channel specifications (horizontal)			
Acquisition modes	Sample Mode	Sequential sampling with up to 32-point sin(x)/x interpolation	
	Averaging	2 to 1,048,575 averages, up to 12,000 avg/sec (HW accelerated)	
	Peak detect	Oversamples at 16 GSa/s, saving min and max voltages, to detect glitches or aliasing

	Cycle-cycle / N-cycle	$\sqrt{3} \times \sqrt{\left(\frac{\text{noise floor}}{\text{slew rate}}\right)^2 + (\text{intrinsic jitter})^2}$	
Inter-channel jitter measurement floor ^{2,3,4}	$\sqrt{\left(\frac{\text{Time interval}}{\text{error (edge 1)}}\right)^2 + \left(\frac{\text{Time interval}}{\text{error (edge 2)}}\right)^2 + \left(\frac{\text{inter - channel}}{\text{intrinsic jitter}}\right)^2}$		
Delta time measurement accuracy ^{2,3,4,8}	Intra-channel	$\pm \left[\frac{5}{n} \times \sqrt{\left[\frac{\text{Time interval}}{\text{error (edge 1)}}\right]^2 + \left[\frac{\text{Time interval}}{\text{error (edge 2)}}\right]^2} + \left(\frac{\text{Time scale}}{\text{accuracy}} \times \frac{\text{Delta}}{\text{time}} \right) \right]$	
	Inter-channel	$\pm \left[\frac{5}{n} \times \sqrt{\left[\frac{\text{Time interval}}{\text{error (edge 1)}}\right]^2 + \left[\frac{\text{Time interval}}{\text{error (edge 2)}}\right]^2} + \left[\frac{\text{Interchannel}}{\text{intrinsic jitter}} \right]^2 + \left(\frac{\text{Time scale}}{\text{accuracy}} \times \frac{\text{Delta}}{\text{time}} \right) + \left(\frac{\text{Interchannel}}{\text{skew drift}} \right) \right]$	

1. Denotes warranted specifications, all others are typical. Specifications are valid after a 30-minute warm-up period and ± 5 °C from firmware calibration temperature.
2. Sample rate at maximum. Noise floor and slew rate determined at fixed-voltage measurement threshold, near middle of signal. Displayed signal not vertically clipped. Slew rate of sine wave = (peak signal amplitude) × 2πf; slew rate of fast edge = 0.8 * amplitude / (risetime 10-90%).
3. Intra-channel = both edges on the same channel, Inter-channel = two edges on different channels.
4. Scope channels and signal interconnect de-skewed prior to measurement.
5. External timebase reference values measured using a Wenzel 501-04608A 10 MHz reference. Intrinsic jitter value depends on acquisition time range for Time Interval Error formula and depends on delta-time between edges for all two-edge formulas.
6. Skew between channels caused by ± 5 degrees C temperature change.
7. Initial = immediately after factory or user calibration.
8. Reading is the displayed Delta Time Measurement Accuracy measurement value. Do not double the listed Time Scale Accuracy value in Delta Time Measurement Accuracy formula. 'n' represents the square root of the number of averages taken; e.g. n=1 is no averaging, n=16 is 256 averages. Averaging allows for more accurate delta time measurement accuracy.
9. 120 f_{RMS} possible with external reference.
10. 161 f_{RMS} possible with external reference.

Analog channel triggering	
Trigger sources	Edge Trigger on all analog channels, aux-in, power supply line Other Trigger operations as outlined below
Max edge trigger frequency (50 Ω)	6 GHz
Trigger level range	± 4 divisions from center screen (auxiliary: ± 5 V, max input 5 VPP)
Trigger sensitivity	Analog channels: see next table Aux trigger input: 200 mVPP, DC to 3 GHz

Threshold selections	TTL, CMOS (5.0 V, 3.3 V, 2.5 V), ECL, PECL, User-defined (± 8 V in 10 mV increments)
Threshold accuracy	$\pm (100$ mV + 3% of threshold setting)

Available triggers (standard, unless otherwise noted)		
Trigger type	Channels available on	Description
Edge	Channels 1-8, digital, line, aux	Triggers on a specified slope (rising, falling or alternating between rising and falling) and voltage level on any channel or auxiliary trigger.
Edge transition	Channels 1-4	Triggers on rising or falling edges that cross two voltage levels in > or < the amount of time specified. Edge transition setting from 75 ps to 10 s
Edge then edge (time)	Channels 1-4, digital	The trigger is qualified by an edge. After a specified time-delay between 1.5 ns to 20 s, a rising or falling edge on any one selected input will generate the trigger
Edge then edge (event)	Channels 1-4, digital	The trigger is qualified by an edge. After a specified delay between 1 to 65,000,000,000 rising or falling edges, another rising or falling edge on any one selected input will generate the trigger
Pulse width	Channels 1-4, digital	Triggers on a pulse that is wider or narrower than the other pulses in your waveform by specifying a pulse width and a polarity. Pulse width range settings 75 ps to 20 s. Trigger point can be configured for "end of pulse" or "time out"
Glitch	Channels 1-8, digital	Triggers on glitches narrower than the other pulses in your waveform by specifying a width less than your narrowest pulse and a polarity. Glitch range settings: < 75 ps to < 10 s
Runt	Channels 1-4	Triggers on a pulse that crosses one threshold but fails to cross a second threshold before crossing the first again. Can be time qualified with a range of 75 ps to 10 s
Timeout	Channels 1-4, digital	Triggers the oscilloscope when the waveform has been at a higher voltage than the voltage specified by the Level control for too long (High Too Long), when the waveform has been at a lower voltage than the Level voltage for too long (Low Too Long), or when the waveform has taken too long to pass through the Level voltage (Unchanged Too Long). Timeout settings from 75 ps to 20 s.
Pattern/State	Channels 1-4, digital	Identifies a trigger condition by looking for a specified pattern or a pattern and an edge (state) across the input channels
Setup / hold	Channels 1-4	Triggers on violations of setup time, hold time, or both setup and hold time. Setup times from 75 ps to 20 s and hold times from 75 ps to 100 ns.
Window	Channels 1-4	Specifies a voltage range and then trigger when the waveform either exits this range, enters this range, stays outside the range for too long or too short, or stays inside the range for too long or too short. Range setting from 75 ps to 20 s.
Protocol	Bus dependent	Trigger on certain packets or patterns in protocol-based data. Requires a protocol trigger/decode option, for example D9010LSSP
Generic Protocol	Channels 1-8	Software triggers on NRZ or 8b/10b-encoded data up to 6 Gbps, up to 80-bit pattern. Support multiple clock data recovery methods including constant frequency, 1st-order PLL, 2nd-order PLL, explicit clock, explicit 1st-order PLL, explicit 2nd-order PLL, Fibre Channel, FlexRay receiver, FlexRay transmitter
Burst	Channels 1-4	Triggers on the Nth edge of a burst that occurs after an idle time from 1.5 ns to 20 s.
Nth Edge	Channels 1-8	Triggers on the Nth edge
OR'd Edges	Channels 1-4	Identifies a trigger condition by looking for selected edges on up to four channels
InfiniiScan Zone	Channels 1-8	Qualified trigger across up to 8 user-drawn zones. For each zone, user specifies "must intersect" or "must not intersect." Zones can be drawn on analog channels and combined using Boolean logic. <i>Requires option D9010SCNA</i>
Measurement limit	Channels 1-8, digital, line, aux	Software triggers on the results of the measurement values. For example, when the "time interval error (TIE)" is measured, InfiniiScan can trigger on a specific TIE value. <i>Requires option D9010SCNA</i>
Non-monotonic edge	Channels 1-8	Software triggers on the non-monotonic edge. The non-monotonic edge is specified by setting a hysteresis value. <i>Requires option D9010SCNA</i>

Serial Data Analysis (standard)	
Real-Time Eye displays	> 750,000 Unit Intervals per second Unfolding of eye diagram BER eye contours (contact Keysight) Recovered clock display
Clock recovery methods	1 st or 2 nd order PLL, explicit clock, Golden PLL (for PCI Express)
Automation	One-click quick setup Complete setup wizard Custom mask templates, mask editor

Fault Hunter (standard)	
Auto Setup	30 second statistical measurement analysis of incoming signal
Result information	Test failure automatically saved in memory. Fault condition can be copied to trigger for further testing.
Test results	Automatic identification of common digital signal errors: Positive glitch, negative glitch, slow rising edge, slow falling edge, positive runt, negative runt

Measurements (standard, unless otherwise noted)	
Maximum at once	20 in either main, zoom, or gated region (up to 16 gates)
Maximum rate	> 300,000 measurements/second (any number of measurements on, "measure all edges" enabled)
Voltage (analog)	Amplitude, average, base, crossing point, maximum, minimum, overshoot and preshoot (as a percentage or voltage), VPP contrast, peak to peak, pulse (amplitude, base, top), RMS, top, thresholds (lower, middle, upper), voltage @ time
Time (analog)	Rise time, fall time, period, frequency, pulse width (+/-), duty cycle, TMIN, TMAX, crossing point time, delta time, pulse count, bursts (width, period, interval), s/h time
Time (digital)	Period, frequency, pulse width (+/-), duty cycle, delta time
Mixed (analog)	Area, slew rate, charge. Requires N282xA probe
Frequency domain	FFT frequency and magnitude, channel power, power spectral density, occupied bandwidth
Level qualification	Make timing measurements only when other input signal level conditions are true. Any channels not involved in a measurement can be used to qualify all timing measurements. Requires D9010SCNA
Eye diagrams	Eye height, eye width, eye jitter, crossing percentage, Q factor, duty-cycle distortion > 750,000 UI/second (for eye diagrams, with hardware acceleration enabled)
Statistic modes	Mean, standard deviation, minimum, maximum, count

Math (standard, unless otherwise noted)		
Sources		Any analog or digital channel, waveform memory, or other math functions
Maximum at once		16
Functions	Math	Add, subtract, multiply, divide, FFT (magnitude and phase), absolute value, average, common mode, delay, differentiate, integrate, invert, max, min, square, square root
	Filters	High pass filter, low pass filter, smoothing
	Visualizations	Amplitude demodulation, bus chart, envelope, gating, histogram, pattern average, measurement log, measurement trend, magnify / duplicate, XY mode (Z-Qualified)
	MATLAB	Preinstalled scripts: Butterworth, FIR, LFE, RTEye, and SqrtSumOfSquare User Defined: The input source data is passed to a MATLAB script you create. The processed data is passed back to Infiniium to be displayed as a function. Requires a MATLAB license
FFT	Range	DC to Nyquist frequency
	Horizontal Scale	Linear, logarithmic
	Vertical Units	dBm, dBmV, dBuV, V _{RMS} , Watts
	Controls	Start and stop frequency, span and center frequency, resolution bandwidth
	Peak detect	Automatically find and annotate up to 25 peaks of a user-defined level
	Windows	Flattop, rectangular, Hanning, Blackman Harris, Hamming
Histograms	Sources	Any waveform or measurement below
	Orientation	Horizontal (timing and jitter) or vertical (noise and amplitude)
	Measurements	Peak-to-peak, min, max, mean, median, mode, standard deviation, mean $\pm 1\sigma/2\sigma/3\sigma$, total hits, peak (area of most hits), bin width, FWHM (histogram width at half maximum)

Digital Voltmeter (standard, specifications are typical)	
Functions	AC _{RMS} , DC, DC _{RMS}
Resolution	4 digits
Measuring rate	100/sec
Auto Range	Automatic adjustment of vertical amplification to maximize the dynamic range of measurements
Range Meter	Graphical display of most recent measurement, plus extrema over the previous 3 seconds

Counter / Totalizer (standard, specifications are typical)	
Available counters	Counter A and B: general purpose (Channels 1-4)
	Counter C: trigger qualified (trigger channel)
Measurements	Frequency, period, totalize, ratio (ratio of A/B, mathematical)
Resolution	General purpose: 5 to 10 digits
	Trigger qualified: 5 to 8 digits
Accuracy	\pm (8 ppb initial \pm 75 ppb/year aging)
Uncertainty	\pm 0.1 digits
Minimum pulse width	75 ps (for signals with < 10 ns transition time)
Maximum frequency	General purpose: 6 GHz
	Trigger qualified: 1/(trigger hold off time)
Totalizer	Counter size: 64 bits
	Edge: Rise or fall

Waveform Generator (optional, specifications are typical)		
Output	Connector	BNC, rear panel
	Voltage range, 50 Ω	1 mV _{PP} ¹ to 5 V _{PP} ²

Real Time Spectrum Analysis and Digital Down Conversion (optional)							
		RTSA			DDC		
Standard Performance		All Infiniium MXR-Series come with a standard 40 MHz RTSA and DDC analysis bandwidth, with a frequency range up to the oscilloscope bandwidth, and all channels tied to the same center frequency. The specifications below apply to the paid options that unlock full RTSA and DDC performance (see configuration guide).					
Frequency Range		0 Hz to oscilloscope bandwidth 0 Hz to 6 GHz with Frequency Extension (below)					
Analysis Bandwidth		40, 80, 160, or 320 MHz. RTSA total Span is 320 MHz for channels 1-4 and channels 5-8. Examples: 320 MHz span on channels 1, 5; 160 MHz span on channels 1, 2, 5, 6; 80 MHz span on channels 1 through 8			40 MHz, 80 MHz, 160 MHz, 320 MHz, 640 MHz, 1.28 GHz, 2.16 GHz (all channels)		
Per-channel control		All channels use the same span, but can each be at different center frequencies. No data is stored; visualization only			All channels use the same span (up to 2 GHz), but can each be at different center frequencies. Each channel stores IQ data for analysis via Keysight VSA (89600) or MATLAB (N6171A)		
Performance Data		Typical passband magnitude flatness: ± 25 dB from 160 MHz to max Frequency Range			Typical out-of-band rejection: > 50 dB		
Minimum signal duration with 100% amplitude accuracy		15 μ s			N/A		
Minimum detectable signal duration		10 ns			N/A		
Available views		Spectral density (color graded)			Histogram		
Supported triggers		Frequency mask trigger: must intersect, must not intersect, up to 8 zones (AND logic)			All oscilloscope time domain triggers, external trigger		
Window types		Rectangular, Hanning, Hamming, Blackman-Harris, Flattop					
Number of markers		200					
Supported marker types		Frequency, amplitude

2.16 GHz	3.2 GSa/s	781 KHz	1.07 MHz	1.17 MHz	1.56 MHz	2.98 MHz	

Frequency Extension (optional)	
Enables a frequency range of DC to 6 GHz for RTSA and DDC options, regardless of oscilloscope bandwidth. If this option is enabled by itself (i.e. without the 160 MHz or 320 MHz RTSA option), the user gets the standard performance of the RTSA and DDC features listed above, but with an adjustable maximum frequency of 6 GHz.	

Display	
Size / Resolution	15.6" capacitive multi-touch, Full HD (1920x1080)
Annotations	Up to 100, floating or anchored
Grids and Windows	Up to 16 grids on up to 8 waveform windows
Waveform modes	Connected samples (sin(x)/x interpolated or lines), dots only
Persistence modes	Infinite, variable, color graded

Computer system	
Operating system	Windows 10
CPU	Intel Core i5-6500, 3.2 GHz

LAN	RJ-45 connector, supports 10/100/1000Base-T. Enables Web-enabled remote control, email on trigger, data/file transfers and network printing (supports up to 80 MB/s data offloading)
USB	4x USB 2.0 host ports (2x front panel, 2x side panel), 2x USB 3.0 host ports (side panel), 1x USB 3.0 device port (side panel, supports up to 200 MB/s data offloading)
Audio	Microphone, line in, line out
Display out	DisplayPort and VGA (supports up to two simultaneous displays)
Trigger out	TTL levels, high impedance load
Auxiliary out	Configurable: DC level, probe compensation, trigger out, or a demo signal
Timebase reference output	Amplitude into 50 Ω : 1.65 \pm 0.05 Vpp (8.3 \pm 0.3 dBm) sine wave (internal or external timebase reference selected)
	Frequency: 10 MHz \pm (8 ppb initial + 75 ppb/year aging) when internal timebase reference is selected; external reference frequency when external timebase reference is selected
Timebase reference input	Amplitude into 50 Ω : 356 mVPP (-5 dBm) to 5 VPP (+18 dBm) sine, 285 mVPP to 4 VPP square
	Frequency: 10 MHz \pm 5 ppm

Supported file types		
Infiniium setup files	.set	Infiniium settings only
	.osc	settings and waveform data
Waveform files, compressed	.wfm	binary, Infiniium format
	.bin	binary, approx. 5x smaller than larger XY formats
	.h5	open source, Infiniium or InfiniVision format
	.mat	MATLAB
Waveform files, raw data	.csv	XY values, comma-separated
	.tsv	XY values, tab-separated
	.txt	Y values
Image files	.png	24-bit color
	.jpg	24-bit color
	.bmp	24-bit color
	.gif	8-bit color
	.tif	8-bit color
All images may be saved or printed with waveforms only, inverted backgrounds, with setup info, and/or in a compressed format.

Probes and accessories

The Infiniium MXR-Series oscilloscopes include both 1 M Ω and 50 Ω paths. This expands their flexibility by making them compatible with a wider range of probes than high-performance oscilloscopes that only support a 50 Ω path. All models ship standard with an N2873A 500 MHz passive probe per channel, and support a wide range of about 100 compatible current and voltage probes.

Additionally, legacy probes from Tektronix may be used on the MXR-Series with the proper adapter, listed below. See the data sheet for a list of compatible probes.

The table below highlights probes commonly used with the Infiniium MXR- Series. Read *The Infiniium Oscilloscope Probes and Accessories Guide* for additional information, or visit the Probe Resource Center at prc.keysight.com.

Category	Models	Description
Passive	N2870A-76A	2.5 mm probe tip diameter for fine pitch component probing, easily replaceable spring-loaded or solid probe tip, 10-25 pF input C (high-Z, 10:1) covers wide range of scope input, 7 probes and 4 accessory kits available, N2873A shipped with Infiniium MXR series
Hi-Z+ Passive <i>All New!</i>	PP0001A-03A	Three passive probes that, with the help of an adapter, can achieve best-in-class bandwidth, voltage, and loading specifications, up to 1 GHz or 1.2 kV.
Digital	N2756A	Ships with MXR000-MSO or MXR2MSO options. 16 flying leads with grabbers, ground leads, and other accessories.
Single-ended Active	N2795A-97A	Up to 2 GHz, low cost, high impedance input (1 M Ω at DC), wide dynamic/offset range, headlight, -40 to +85 C of extreme temp range for chamber testing (N2797A)
Differential low voltage	N2750A-52A	Up to 6 GHz, 200 k Ω input, InfiniiMode for Diff, SE, CM probing, built-in multifunction scope control, headlight
Differential high voltage	DP0001A	400 MHz, 2 kV input, high CMRR > 80 dB at DC, UL safety certified
Current	N7026A	150 MHz, 30 ARMS, 1 mV/div sensitivity clamp-on, AutoProbe interface
High sensitivity current	N2820A/21A	3 MHz, measurable down to 100 μ A AC/DC, provides wide dynamic range, ideal for capturing low level current flow
Power rail	N7020A/24A	2 GHz or 6 GHz, low noise for power rail noise measurement, high offset voltage, 50 k Ω loading at DC
Adapter	N2744A	Adapter for using legacy Tektronix TekProbe oscilloscopes. See data sheet for compatible models.

Good, Better, and Best Value Bundles

The Keysight Infiniium MXR-Series oscilloscope enables you to See More, Do More, and Save Time like no other oscilloscope in its class – with a full set of features and capabilities right out of the box. However, to unlock even more functionality, the Infiniium MXR-Series also has a wide variety of additional options, software, and probing.

Knowing what to order for your specific application can be daunting, so we have taken the hard part out of ordering by pre-packaging commonly used features into convenient bundles. Now, it's as easy as choosing your oscilloscope model and the bundle that best suits your needs, taking advantage of immediate savings in the process.

To take advantage of each value bundle, simply select your Infiniium MXR-Series oscilloscope model and then purchase one of the following additional Good, Better, or Best Value Bundles. The following options, software, and probes are included in each bundle:

		Good Bundle	Better Bundle	Best Bundle
MXR000-MSO	16 Digital Channels	✓	✓	✓
MXR000-WAV	50 MHz Waveform Generator	✓	✓	✓
D9010LSSP	Low Speed Protocol Bundle	✓	✓	✓
MXR000-400	400 Mpts/ch Memory Upgrade		✓	✓
D9010SCNA	InfiniiScan Trigger Software		✓	✓
N2796A (x2)	2 GHz Single-Ended Active Probes		✓	✓
MXR000-320	Real Time Spectrum Analysis – 320 MHz Analysis Bandwidth			✓
MXR000-01T	Removable 1 TB SSD Upgrade			✓
D9010JITA	EZJit Complete (Vertical, Timing, Phase Noise Analysis)			✓
Total savings on the above options:		Save ~10%	Save ~23%	Save ~22%

Offline testing

View and analyze test results at your desk! Save an oscilloscope file, then view and analyze on your PC using the full Infiniium user interface without needing additional access to your scope. Infiniium Offline uses the exact same code as your Infiniium MXR-Series.

Use waveform math, filtering, FFT, protocol decoding, jitter analysis, eye diagrams and more to get more insight. Infiniium offline is a truly powerful software tool to help you get your job done faster while freeing up precious hardware resources. See the Infiniium Offline data sheet to learn more.

Description	Details	Option
Infiniium Offline	Required as baseline software. Prerequisite to all other options.	D9010BSEO
EZJit Complete	Timing jitter, vertical noise, and phase noise analysis.	D9010JITO

Low Speed Protocol Package	I ² C, SPI, RS232/UART, JTAG, CAN, CAN-FD, LIN, FlexRay, SVID, USB 2.0, USB-PD, MIPI RFFE, eSPI, I2S, Ethernet 10/100BaseT, SpaceWire, SPMI, 100BASE-T1, Manchester, ARINC429, MIL-STD1553)	D9010LSPO
High Speed Protocol Package	DDR2/3/4, LPDDR2/3/4, Ethernet 10GBASE-KR 64/66, Ethernet 100Base KR/CR, MIPI [CSI-3, DigRF v4, D-PHY, LLI, RFFE, UniPro], PCIe Gen 1/2/3, SATA/SAS, UFS, USB 2.0, USB 3.0, USB 3.0 SSIC, USB 3.1, C-PHY	D9010HSPO

Post-purchase upgrades

Hardware options	Model
Add logic analysis, 16 channels (includes N2756A probe)	MXR2MSO
Add arbitrary waveform generator, 50 MHz	MXR2WAV
Add frequency response analyzer (Bode plots)	Included with D9010PWRA or AWG options
Add memory, 400 Mpts/ch or 1.6 Gpts combined flexible memory	MXRMEM
Rackmount Kit, 8U	MXR2RACK
Additional Removable SSD, 500 GB or 1 TB	MXR2SSD
RTSA (160 MHz or 320 MHz) and DDC (2 GHz)	MXR2RTSA
Frequency Extension; extend RTSA and DDC frequency range to 6 GHz	MXR2FRE

Analog channel upgrades (from 4 channels, to 8 channels)			
For 500 MHz models:	MXR28CH-001	For 2.5 GHz models:	MXR28CH-004
For 1 GHz models:	MXR28CH-002	For 4 GHz models:	MXR28CH-005
For 2 GHz models:	MXR28CH-003	For 6 GHz models:	MXR28CH-006

Requires return to Keysight service center. Model and serial number are kept. Cost of upgrade does not include shipping.
